

Docket: T00362
Application: 10/029,928

In the Claims:

Please amend the Claims as follows:

Claims 1-28 are cancelled.

Claims 29- 43 are newly added without introducing new matter.

29. (New) A residential gateway that connects a Wide Area Network (WAN) to an in-home network, said residential gateway connecting at least one residential device over said in-home network, the residential gateway:

forwarding state information of said at least one residential device to a control server over said WAN;

forwarding economic setpoint information to said control server over said WAN;

receiving control parameters from said control server over said WAN, said control parameters determined by the control server based on at least the following information: relevant control information accessed from one or more climatic information providing servers on said WAN, said forwarded state information of said at least one residential device and said forwarded economic setpoint information,

whereby said residential gateway controls said at least one residential device based on said received control parameters.

30. (New) A residential gateway that connects a Wide Area Network (WAN) to an in-home network, as per claim 29, wherein said at least one residential device is a home irrigation system comprising:

Docket: T00362
Application: 10/029,928

an irrigation controller connected to said residential gateway; and
at least one sprinkler connected to said irrigation controller.

31. (New) A residential gateway that connects a Wide Area Network (WAN) to an in-home network, as per claim 30, wherein a watering cycle constitutes said control parameters for said home irrigation system.

32. (New) A residential gateway that connects a Wide Area Network (WAN) to an in-home network, as per claim 31, wherein said watering cycle is also determined based on said economic point information.

33. (New) A residential gateway that connects a Wide Area Network (WAN) to an in-home network, as per claim 29, wherein said economic setpoint information is set to control amount of electricity or water used by said at least one residential device during a particular time period.

34. (New) A residential gateway that connects a Wide Area Network (WAN) to an in-home network, as per claim 30, wherein said irrigation controller is connected to said residential gateway via an IEEE 802.11b wireless interface.

35. (New) A residential gateway that connects a Wide Area Network (WAN) to an in-home network, as per claim 29, wherein said Wide Area Network is the Internet.

Docket: T00362
Application: 10/029,928

36. (New) A control server connected to a residential gateway via a Wide Area Network (WAN) to control at least one residential device connected to said residential gateway, said control server:

retrieving relevant control information from one or more climatic information providing servers on said WAN;

receiving state information of said at least residential device from said residential gateway;

receiving economic setpoint information from said residential gateway;

determining control parameters to control said at least one residential device based on at least the following information: said received state information, said retrieved relevant control information, and said received economic setpoint information;

communicating said control parameters to said residential gateway via said WAN;

wherein said residential gateway communicates with said at least one residential device to provide control of the residential device based on said control parameters.

37. (New) A control server connected to a residential gateway via a Wide Area Network (WAN) to control at least one residential device connected to said residential gateway, as per claim 36, wherein said at least one residential device is a home irrigation system comprising:

an irrigation controller connected to said residential gateway; and

at least one sprinkler connected to said irrigation controller.

Docket: T00362
Application: 10/029,928

38. (New) A control server connected to a residential gateway via a Wide Area Network (WAN) to control at least one residential device connected to said residential gateway, as per claim 37, wherein a watering cycle constitutes said control parameters for said home irrigation system.

39. (New) A control server connected to a residential gateway via a Wide Area Network (WAN) to control at least one residential device connected to said residential gateway, as per claim 38, wherein said watering cycle is also determined based on said economic point information.

40. (New) A control server connected to a residential gateway via a Wide Area Network (WAN) to control at least one residential device connected to said residential gateway, as per claim 36, wherein said economic setpoint information is set to control amount of electricity or water used by said at least one residential device during a particular time period.

41. (New) A control server connected to a residential gateway via a Wide Area Network (WAN) to control at least one residential device connected to said residential gateway, as per claim 37, wherein said irrigation controller is connected to said residential gateway via an IEEE 802.11b wireless interface.

42. (New) A control server connected to a residential gateway via a Wide Area Network (WAN) to control at least one residential device connected to said residential gateway, as per claim 36, wherein said Wide Area Network is the Internet.

Docket: T00362
Application: 10/029,928

43. (New) An article of manufacture comprising a computer usable medium having computer readable program code embodied therein which provides determining control parameters by a control server, said medium comprising:

computer readable program code aiding in retrieving relevant control information from one or more climatic information providing servers on said WAN;

computer readable program code aiding in receiving state information of said at least residential device from said residential gateway;

computer readable program code aiding in receiving economic setpoint information from said residential gateway;

computer readable program code determining control parameters to control said at least one residential device based on at least the following information: said received state information, said retrieved relevant control information, and said received economic setpoint information; and

computer readable program code aiding in communicating said control parameters to said residential gateway via said WAN, said residential gateway communicating with said at least one residential device to provide control of the residential device based on said control parameters.
